Problem Statement –Research Agent

The Challenge

Students often spend significant time searching multiple websites for reliable academic information. Existing resources may provide incomplete, outdated, or scattered content, making it difficult to obtain quick and accurate learning support.

The Objective

Develop **Scholar AI**, an AI-powered educational assistant that provides instant, accurate, and personalized academic guidance through a simple conversational interface. The system aims to improve learning efficiency by delivering reliable responses in real time.

Proposed Solution

Proposed Solution

Scholar AI is an AI-powered educational assistant developed using **IBM Watsonx Orchestrate**, **IBM Granite 13B Chat v2**, **Python Flask**, **HTML**, **CSS**, and **JavaScript**. The application enables students to ask academic questions through a user-friendly web interface.

The frontend sends user queries to a Flask backend, which securely communicates with IBM Watsonx Orchestrate. Powered by IBM Granite, the AI processes each query and returns accurate, context-aware educational responses in real time. Scholar AI provides an interactive and efficient learning experience while reducing the effort required to search across multiple educational resources.

Technology Used

IBM Watsonx Orchestrate – Built and managed the Scholar AI agent workflow.

IBM Granite 13B Chat v2 – Generated intelligent, context-aware academic responses.

IBM IAM (OAuth) – Secured API access using bearer token authentication.

Python 3.11 & Flask – Developed the backend and integrated AI services.

HTML5, CSS3 & JavaScript – Created the responsive web-based user interface.

Requests & Flask-CORS – Enabled secure API communication between frontend and backend.

Git, GitHub & VS Code – Used for version control and application development.

Gunicorn & Environment Variables – Supported deployment and protected sensitive credentials.

Watsonx Orchestrate Components Used

- **1. Chat Input** – Accepts academic questions entered by the user through the Scholar AI web interface.
- **2. AI Agent (Watsonx Orchestrate)** – Receives user queries, manages the workflow, and coordinates response generation.
- **3. IBM Granite 13B Chat v2** – Processes the query using natural language understanding and generates accurate academic responses.
- **4. API Integration** – Connects the Flask backend with IBM Watsonx Orchestrate using secure IBM IAM authentication.
- **5. Chat Output** – Displays AI-generated answers and explanations to the user in real time.

Workflow -

Architecture blueprint :

Role of Agentic AI in the solution

Agentic AI enables **Scholar AI** to function as an intelligent academic assistant by understanding user queries, reasoning over the context, and generating accurate responses. Using **IBM Watsonx Orchestrate** and the **IBM Granite 13B Chat v2** model, the system autonomously processes requests and delivers relevant educational assistance in real time. Instead of providing predefined answers, Agentic AI interprets natural language, manages the conversation flow, and produces context-aware responses based on the student's questions. This makes Scholar AI more interactive, efficient, and personalized. Overall, Agentic AI transforms Scholar AI into a smart learning companion that offers reliable, instant, and user-friendly academic support, enhancing students' learning experience.

Novelty and Uniqueness

Agentic AI Approach – Uses IBM Watsonx Orchestrate with IBM Granite to provide intelligent, context-aware academic assistance.

Real-Time Learning Support – Delivers instant and accurate responses through a conversational interface.

Secure Architecture – Implements IBM IAM authentication and secure API integration for reliable access.

User-Friendly Web Application – Built with Flask, HTML, CSS, and JavaScript for a simple and responsive learning experience.

Scalable Design – Can be extended with document analysis, multilingual support, and personalized learning features.

Git Hub Link

Github Link:- <https://github.com/sreeniranjana10ks-max/Scholar-AI.git>

.

.

.

Future Scope

Personalized Learning – Recommend study plans based on students' learning progress and preferences.

Multilingual Support – Enable interactions in multiple languages to improve accessibility.

Document Analysis – Allow users to upload PDFs and notes for AI-powered summarization and question answering.

Mobile Application – Develop Android and iOS apps for learning anytime, anywhere.

describe me about research trends in computer science in 2026

You

AI

Predicting exact research trends in computer science for 2026 involves speculation based on current developments and patterns. However, considering the pace at which the field evolves, here are some anticipated areas of focus and potential trends in computer science by 2026:

- Artificial General Intelligence (AGI):** The pursuit of creating machines that possess human-like intelligence across a wide range of tasks will likely remain a significant focus. Researchers aim to develop AI systems capable of understanding, learning, and applying knowledge across diverse domains, much like humans do.
- Quantum Computing:** While still in its early stages, quantum computing is expected to see substantial progress by 2026. Advancements in quantum hardware, error correction, and algorithm development will likely accelerate the transition from theoretical to practical applications.
- Edge Computing and IoT:** As the Internet of Things (IoT) continues to expand, there

Research trends 2024

You

AI

Predicting future research trends involves speculation based on current developments and patterns. As we approach 2024, some emerging trends in various fields of science and technology may include:

1. Artificial Intelligence and Machine Learning:
 - Progress in explainable AI to address ethical concerns and improve transparency.
 - Increased focus on lifelong and continual learning algorithms.
 - Development of AI systems capable of commonsense reasoning.
 - Growth in application of AI in healthcare, particularly for disease diagnosis and personalized treatment plans.
2. Quantum Computing:
 - Advancements in error correction methods for quantum computers.
 - Development of practical quantum algorithms for real-world problems.
 - Integration of quantum computing with classical computing for hybrid systems.

All tasks completed! 11/11

Backend Highlights

- Application factory pattern (create_app()) — testable & scalable
- IBM IAM token caching — refreshes 5 min before expiry, no redundant requests
- Mock mode — full demo responses when credentials aren't set; frontend still fully works
- Research system prompt baked into the OrchestrateService
- All 3 endpoints (GET /, GET /health, POST /chat) with proper HTTP status codes
- Request/response logging with latency tracking on every call
- No hardcoded credentials — 100% environment-variable driven

To run locally:

```
cd backend
cp .env.example .env # Add your IBM credentials
pip install -r requirements.txt
python app.py # → http://localhost:5000
# Then open frontend/index.html in browser
```
